

ABSTRACT

A video camera is disclosed which can make photographing without any compulsion. A rotary grip is provided on a side face of a camera body so as to be rotatable relative to the camera body, the camera body having an image pickup device, a camera lens and a circuit board of various circuits. A hand strap is attached to the rotary grip. For carrying the video camera, the fingers other than the thumb of one hand are inserted between the rotary grip and the hand strap so that the tips thereof are caught on a peripheral surface of the rotary grip. A liquid crystal display monitor and an operating unit are integral with the peripheral surface of the rotary grip, and when the rotary grip is rotated relative to the camera body unit, the hand strap, as well as the liquid crystal display monitor and the operating unit, also rotate. Thus, the direction of the liquid crystal display monitor and that of the operating unit can be changed with respect to a photographing direction, and it is also possible to change the way of carrying the video camera.
